

Living Frontier

Left: visual target for the mobile field surface. Right: current playable portrait HUD. Mobile/casual first means useful outings, readable danger, individual Wildkin, and a family worth returning to.

LEFT IS A VISUAL TARGET. RIGHT IS CURRENT PLAYABLE EVIDENCE.

A pocket field loop

Five persistent quick slots, a fixed left joystick, nearby actions, and a personal atlas support a short useful outing. Landscape remains supported.

Actual portrait HUD and atlas captures.

The atlas remembers

The atlas records personal exploration. The inspector measures current terrain fields for development; it is not a player-facing climate or biome system.

Actual atlas and diagnostic captures.

Bring home an individual

Captured Wildkin keep individual identity through field capture, reload, physical Camp banking, roster selection, and death handling.

Encounters change an outing

Tidefin and Emberhorn reuse adds optional encounter texture. Tidefin snare/release and banking are proved; full native Emberhorn dodge/tether capture remains open.

Actual encounter evidence.

One expressed visual trait

Mossling body tone is visibly expressed across wild, follower, and young paths. Separate eyes, size, markings, and modular parts are not shipped.

Actual before/after body-tone evidence.

Slow terrain asks for care

A bounded climb foundation and fall risk give the first terrain a readable physical edge. Swimming and broad natural climbing remain future work; the new plateau uses walkable ascent and descent.

Actual climb approach evidence.

A physical nursery

One nursery and one garden make care visible. Young and crops advance only during active play, commit on the existing cadence, and do not punish absence.

Actual nursery and garden captures.

Pairing becomes lineage

Natural pairing creates one fixed young. Earned research can guide a parent body tone. Other reproduction modes and genetics controls remain proposals.

Regional grammar, not palette soup

ONE HABITAT FAMILY, FOUR DIFFERENT ARRIVALS

Local terrain, clues and plant structure create variety - concept only

Regions should differ through silhouette, drainage, traversal, life above and below, materials, and discovery situations. Color alone is not ecology.

A personal map of a larger world

A seeded edition can support personal surveying, later community reports, and rare clue-led secrets without promising a predictable global path grid.

Families need compatible parts

Modular Wildkin need compatible rigs, sockets, materials, collision, saves, and readable silhouettes. More part count is not proof of better variety.

Research stays in the world

Observe, compare, understand, then guide one clear eligible trait. Field research should clarify choices without becoming a genetics spreadsheet.

Camp makes care tangible

Habitat, food, gardens, building, and later power can give every collected individual a place in Camp. Current Camp care is intentionally much smaller.

Breeding for resemblance

Pairing, unfertilized eggs, buds and spores suggest different fictional life cycles. Symbiosis can influence readiness. Each needs its own authored rules; mortality and elder choices remain open.

Archive, then begin again

A future DNA archive/cloning path consumes resources, power, time, and capacity. It creates a new individual with provenance, not a restored lived bond.

Habitats are puzzles

Food, shelter, microclimate, and field clues can connect a regional outing to Camp. Persistent clearing and machine/crop components are later bounded systems.

Field notes make sightings matter

Rare secrets should be explainable: clue, route, reason, interaction, and reward. Community maps and trusted trade follow only after their own contracts exist.

A first dramatic plateau

Skybreak rises 27.69 m from its approach to the crown. Four detailed chunks share exact rendered and physical ground. R3 is selected after three passes; its 4.9/10 art score remains below target.

ACTUAL diagnostic overview: fixed camera, fog disabled. Sparse ecology remains work.

A route with consequences

The actual controller reached the crown and returned at full health. A separate crown-side departure fell 30.7 m and cost four health. The left view is on top; the right is after landing below.

Actual portrait captures. Disclosed route/start fixtures; this is not a fresh earned journey.

Extreme land has contracts

ONE HABITAT FAMILY, FOUR DIFFERENT ARRIVALS

Local terrain, clues and plant structure create variety - concept only

Narrow caps, river basins, mountains, deserts, clearable underbrush, overhang meshes, and cave instances need shared surface/collision rules. A heightfield cannot describe an overhang by itself.

What stays deliberately open

Physical-phone comfort, water/swimming, cave lifecycle, full modular anatomy, elder/mortality choices, and trusted online trade remain open. Current growth is active-play only and does not choose all future life-cycle rules.

Actual field capture; open questions are explicit.

Evidence and future direction

Mint headers mark current playable evidence. Proposed concept art is always labeled. Skybreak is a selected terrain prototype; its art target and regional ecology remain incomplete. This report does not claim unshipped traits, climates, trading, or an alternate campaign/save.

Actual HUD beside clearly labeled proposed art.

Next proof, then expansion

The terrain foundation now passes 1,160 tests and packaged checks. Next: give cap and lowland habitats different life and one meaningful discovery. Physical-phone performance and the art target still need work.

Current diagnostic image; new regional geography is being implemented.

From one seed to a place

01 NOW Saved world identity

One fixed edition drives separated terrain and content random streams.

02 LATER Large regional grammar

Choose a landform family, broad climate and connected drainage.

03 NOW Shared supported surfaces

Terrain, physics, map and placements agree on the same ground.

04 LATER Life and discoveries

Reserve homes, resources and meaningful sites by surface and region.

05 NOW Stream nearby detail

Create and retire a bounded neighborhood around the player.

Heightfields cover ordinary ground. Overhang meshes and persistent cave instances will be separate surface owners.

A family grows through play

01 NOW Observe in the field

Earn a clue by studying a living wild Mossling.

02 NOW Make a home

Settle, feed and grow berries at the physical Camp nursery.

03 NOW Choose one influence

Natural pairing or an earned parent body-tone guarantee.

04 NOW Welcome an individual

Commit the young once; active play advances its growth and lineage.

05 LATER Expand the family language

Habitat needs, markings, compatible shapes and other reproduction.

Saved identity belongs to the individual. Rendering, research and growth use that identity rather than creating a second creature inventory.

A horizon that keeps growing

Twice as far from Camp exposes four times the surrounding area. Three times as far exposes nine times as much.

This is geometry, not a forecast of playtime. In a roughly two-dimensional world, area grows with radius squared. New terrain must still offer useful discoveries; distance alone cannot prevent repetition.

Graph: $A / A_0 = (r / r_0)^2$. Normalized circular area; no game-distance promise.

Build a community of explorers

01 NOW A personal field record

The current atlas remembers where each player has explored.

02 LATER Share an expedition story

Screenshots, field sketches and seed/edition coordinates.

03 LATER Collective surveys

Regional mapping challenges and verified discoveries.

04 LATER Exchange a lineage

DNA samples or creatures with clear parents, traits and provenance.

05 LATER Trust the exchange

Online ownership, capacity and atomic trade need an authority.

No online economy ships today. Community goals should reward observation and cooperation without demanding daily care or endless stat grinding.
